A Better Design

“

There are two products
at the end of a programme;
the **thing you have managed to make**,
and [...] **all that you have learned**.

The power of what you have learned enables
you to do the next thing and it enables you to
do the next thing better.

Make Payment

- This capability is for SLC to create, update and retire finance products. The system both must be able to create new products as well as update existing products.
- This includes functionality such as:
 - Create, Update and Retire finance products
 - Search/View payments (e.g. by EIR)
 - Accrue and apply interest
 - Search/View payments (Student, Institution, source etc.)
- Key themes: Single Source of Information, Secure Loan Book

Key themes: Digital, Focus on Prevention, Single Source of Information, Self Service

α Hypothesis *B – Digital Needs Assessment*

We believe offering a digital Needs Assessment capability

for NACs

will achieve structured NAR data, enabling automated processing

we shall know
this is true when

- NACs can digitally submit NARs
- we receive data in a usable format for auto-processing
- we receive positive feedback from NACs

α Tasks

B – Digital Needs Assessment

ANALYSIS B1

What are the existing NAC tools and workflows?

WORKSHOP B2

- Identify NAR data and propose structured schema
- Review and standardise NAR

WORKSHOP B3

- Identify ‘NAC Pilot Group’ and establish comms channel
- Gather NAC input

PROTOTYPE B5

Design and test an interface for digital NAR data entry

WORKSHOP B6

Gather NAC feedback and satisfaction on prototype

spreadsheet

Hand-drawn sketches of a mobile app interface for a product design tool. The sketches include a 'Personal Details' screen, an 'Additional Info' screen, a 'Summary screen', and a 'Recommendations' screen. The 'Recommendations' screen shows a list of items with checkboxes and a 'Submit to SLC' button. The 'Summary screen' shows a 'Back to Report' button and a 'Submit to SLC' button. The 'Additional Info' screen shows a 'Submit to SLC' button. The 'Personal Details' screen shows a 'Submit to SLC' button. The sketches are labeled with 'indicator' and 'sticky panel'.

BETA Complete our quick 5-question survey to [help us improve our content](#).

[Service manual](#) > [Technology](#) > Using progressive enhancement

Progressive enhancement

How to create pages that work regardless of browser capability

Contents

[First, just make it work](#)

[Second, make it work better](#)

[It isn't about "JavaScript off"](#)

[It isn't only about JavaScript](#)

[Further reading](#)

First, just make it work

Make any new page or feature work with HTML alone – no images, no CSS, no JavaScript, nothing but HTML. Interactive elements are only those capable of being implemented with [forms](#) and server-side processing.

This gives a baseline experience, which will work in practically every browser. It allows your site to work for as many people and devices as possible, including older legacy browsers and devices.

Second, make it work better

From this baseline, extra layers can then be added:

- the page can have images
- advance styling can be applied
- interactions can be made smoother and faster without the need to refresh the entire page
- validation of submitted data can be performed before it hits the network
- charts and data tables can be turned into visualisations with interactive elements

[It isn't only about JavaScript](#)

[Further reading](#)

First, just make it work

Make any new page or feature work with HTML alone – no images, no CSS, no JavaScript, nothing but HTML. Interactive elements are only those capable of being implemented with [forms](#) and server-side processing.

This gives a baseline experience, which will work in practically every browser. It allows your site to work for as many people and devices as possible, including older legacy browsers and devices.

Second, make it work better

From this baseline, extra layers can then be added:

- the page can have images
- advance styling can be applied
- interactions can be made smoother and faster without the need to refresh the entire page
- validation of submitted data can be performed before it hits the network
- charts and data tables can be turned into visualisations with interactive elements

Springer offers competitive rates and benefits package including 30 days holiday, a new mobile, healthcare pension scheme, 10 advance discounted gym memberships, cycle to work scheme, childcare vouchers and an employee support programme.

Legal

Springer is an Equal Opportunities Employer. We welcome all applications irrespective of race, gender, age, religion or belief, ethnicity, disability, pregnancy/maternity, sexual orientation or family status.

For further information, contact our HR team at hr@springer.com or write to Springer IT HR Team, 120 Great Portland Street, London W1W 6AQ.

YOU

- have a passion for building things, and releasing them to customers as early as possible
- have the soul of a designer, and the skills of an engineer - a confident web geonerd who likes to think, break things, and learn something for most time
- are also co-curious, and want to contribute ideas and interactions to the design team - the sooner you can get ideas into code and test them in the browser, the better
- are interested in designing robust modular systems, not static websites
- probably see the world in semantic markup and form style sheets
- are friendly and adaptable, detail-orientated, and enjoy working transparently

Abstract

We propose the ion-beam sputtering deposition providing Ti thin films of desired crystallographic orientation and smooth surface morphology not obtainable with conventional deposition techniques such as magnetron sputtering and vacuum evaporation. The sputtering was provided by argon broad ion beams generated by a Kaufman ion-beam source.

Introduction

Titanium has been a frequently used material in microelectronics and MEMS technology. Titanium thin films have been used as sensing electrodes, buffer, or adhesive layers. The advantages of titanium thin films are good electric conductivity, extraordinary chemical reactivity, thermal stability, high hardness, high melting point, and lower number of crystallographic

Experimental details

The deposition of titanium layers was done on substrates (20 × 20 mm) sized from 4-inch P-type silicon wafers with the (100) crystallographic orientation and the resistivity of 6–12 Ω cm covered with thermal silicon dioxide (ON Semiconductor). The thickness of silicon dioxide was approximately 1 μm. Before the sputtering process, we cleaned all substrates in the standard piranha solution (96 % H₂SO₄ + 30 % H₂O₂ in the 3:1 ratio) for 5 min, rinsed in deionized water (18.2 MΩ cm), and dried them by compressed nitrogen.

Table 1
Ion-beam sputtering experimental setup (RF, AV, BC, RFP, Ar flow) and deposition parameters and rate

Sample no.	RF (W)	AV (V)	BC (mA)	RFP (W)	Ar flow (sccm)	Process pressure (mbar)	Deposition rate (Å/s)
1-1	200	-100	5.0	75	2.2	2.1 × 10 ⁻⁴	0.04–0.08
1-2	400	-80	10.0	75	2.4	2.2 × 10 ⁻⁴	0.10–0.18
1-3	600	-120	15.0	80	2.6	2.2 × 10 ⁻⁴	0.24–0.26

Conclusion

We have presented the optimized deposition process of the (001) preferentially oriented titanium thin film using the Kaufman ion-beam source. The performed experiments have shown that both the low energy and the low ion-beam current are necessary for deposition of highly oriented Ti thin films with the only (001) preferential orientation of film crystallites parallel to the

Q1 Goals
 build O.A. Journal articles w/ no LookInside
 boxed new interface design + build.

Alpha: POC

~2 wks

Bootstrap the app:

- eg. create new app - render any OA article
- deploy to platform
- Ass reference (linked alpha)
- UI: first version HTML template
- perf + development metrics (dev dashboard?)
- monitor existing feature usage / audit existing features (inc. loaded / hidden / etc)
- URLS? + Block robots
- released to production, only visible internally
- form SLUG
- Accessibility browserbag
- Comms Strategy

Beta: "Sneak Peek"

~4 wks

- Focus on core content + functionality
- gather user feedback

eg

- typesetting
Responsive layout
Iterate on article content
- Sneak Peek navigation
Feedback mechanism
User analytics + business metrics (can track stats → Track)
- Start device testing + usability testing

- RDFs / Enumeration
PDF +
cover image
article navigation
iterate Rich Media presentation
- Print
Citation info
Google Scholar meta + canonical url

patly

Gamma: "Switchover"

~4 wks

- Prepare to replace existing O.A. journal articles
- Add remaining additional functionality
- UI + brand furniture inc. w/ SL
- article metrics
- export citations
- Related Content (dissemination)
- Add to Papers, etc...
- collect support tickets
- is new Article persisted?

MEP ACTIVITY MODEL

The image shows a wall-mounted Kanban board with four main sections: PROVIDERS, COURSES, MANAGE USERS, and ACADEMIC YEARS. Each section has a header row with specific categories. The board is populated with numerous yellow, orange, and blue sticky notes, many of which contain handwritten text and dates. A small calendar grid is visible in the bottom right corner of the board.

The image shows a wall covered with numerous colorful sticky notes, organized into several columns and rows, representing a project plan or workflow. The notes are color-coded: yellow, blue, orange, and light blue. Some notes have checkboxes, and some are crossed out with red X's. The notes are arranged in a way that suggests a sequence of tasks or a process flow. The background is a plain wall.

Yellow Notes (Top Row):

Abstract

We propose the ion-beam sputtering deposition providing Ti thin films of desired crystallographic orientation and smooth surface morphology not obtainable with conventional deposition techniques such as magnetron sputtering and vacuum evaporation. The sputtering was provided by argon broad ion beams generated by a Kaufman ion-beam source. In order to achieve the optimal properties of thin film, we investigated the Ti thin films deposited on an amorphous thermal silicon dioxide using X-ray diffraction, and atomic force microscopy. We have optimized deposition conditions for growing of thin films with the only (001) preferential orientation of film crystallites, and achieved ultra-low surface roughness of 0.55 nm. The deposited films have been found to be stable upon annealing up to 300 °C which is often essential for envisaging subsequent deposition of piezoelectric AlN thin films.

Introduction

Titanium has been a frequently used material in microelectronics and MEMS technology. Titanium thin films have been used as sensing electrodes, buffer, or adhesive layers. The advantages of titanium thin films are good electric conductivity, extraordinary chemical resistivity, thermal stability, high hardness, high melting point, and lower number of crystallographic imperfections [1–5]. Crystallographic orientation of titanium thin films has to be controlled during the deposition process to obtain specific properties (e.g., mechanical, chemical) suitable for an eventually required application [6, 7]. Some of recent MEMS devices use the piezoelectric effect for energy harvesting or sensing purposes [8]. Titanium has been often utilized in MEMS technology as a compatible material for fabrication of thin conductive underlying electrodes on which the piezoelectric layers are deposited [6].

The crystallographic orientation of titanium thin films is crucial for properties of consequently deposited piezoelectric layers [9]. Obviously, the properties of these layers (AlN, ZnO), namely electromechanical properties, are significantly affected by the crystallographic orientation, surface morphology, and the roughness layers beneath [10]. There have been many papers published investigating the degree of orientation which is strongly dependent on the texture and roughness of underlying material [11, 12]. Titanium thin films have been usually deposited by the physical vapor deposition (PVD) particularly magnetron sputtering [13] or e-beam evaporation [4]. Obviously, different deposition parameters result in various film properties. Considering the surface roughness, low process pressure during deposition (i.e., $<5 \times 10^{-3}$ mbar) usually results in a smooth film surface (i.e., $R_{\text{rms}} < 10$ nm). At higher deposition pressure (i.e., $<14 \times 10^{-3}$ mbar), the titanium RMS surface roughness of 45 nm was achieved. Consequently, a negative effect on the piezoelectric coefficients of AlN layers deposited on Ti thin film due to a porous surface was observed [10]. The magnetron sputtering is the most frequent method for titanium thin films deposition [14]. Titanium thin films deposited by the magnetron sputtering generally possess (100), (001), and (101) crystallographic orientations of crystallites parallel to the surface [1]. Without a special modification of the magnetron sputtering process (closed-field unbalanced magnetron sputtering, pulsed magnetron sputtering), the number of various and independent deposition parameters capable of optimizing deposited layers is limited [15, 16]. Due to the lack of the process control parameters, it is often an issue to achieve thin films of desired properties for specific application.

In this paper, we report on a deposition of Ti thin film with the (001) preferential crystallite orientation growth on amorphous thermal silicon dioxide using a 3-grid radio frequency inductive-coupled plasma (RFICP) Kaufman ion-beam source. As generally known, the Kaufman ion-beam source provides more efficient control and optimization of the deposition process compared to the conventional deposition method [17, 18]. Here, ion-beam flux, energy, and ion-beam geometry, can be controlled independently. We have studied the influence of deposition parameters on properties of Ti thin films especially on their preferential crystallographic orientation and topography.

Experimental details

Deposition process

The deposition of titanium layers was done on substrates (20 × 20) mm diced from 4-inch P-type silicon wafer with the (100) crystallographic orientation and the resistivity of 6–12 Ω cm covered with thermal silicon dioxide (ON Semiconductor). The thickness of silicon dioxide was approximately 1 μm. Before the sputtering process, we cleaned all substrates in the standard piranha solution (96 % H₂SO₄ + 30 % H₂O₂ in the 3:1 ratio) for 5 min, rinsed in deionized water (18.7 MΩ cm), and dried them by compressed nitrogen.
